1. A method of test generation for testing computer software, comprising the steps of:

modeling a software application as a finite state machine to define a behavioral model;

associating said behavioral model with a focus, said focus having a reference to said behavioral model, and having at least one directive; and

generating a test program according to state transitions of said behavioral model and said directive of said focus.

- 2. The method according to claim 1, wherein said directive comprises a model independent directive.
- 3. The method according to claim 1, wherein said directive comprises a model dependent directive, and a coverage variable of said behavioral model is tagged by a tag of said model dependent directive, said coverage variable having allowable values.
- 1 4. The method according to claim 3, wherein said di-2 rective further comprises a model independent directive.
- 1 5. The method according to claim 3, wherein said test 2 program references said coverage variable, and said step

3 of generating is performed until said coverage variable has assumed each of said allowable values. 4

- 6. The method according to claim 5, wherein said coverage variable comprises a plurality of coverage variables, and said step of generating is performed until a cross product of said coverage variables has assumed all possible values thereof.
- 7. The method according to claim 5, wherein said coverage variable comprises a plurality of coverage variables, and said step of generating is performed until an orthogonal array of said coverage variables has assumed all possible values thereof.
- 8. The method according to claim 3, wherein said model dependent directive comprises a plurality of model dependent directives, and said coverage variable is tagged by a plurality of tags of said model dependent directives.
- 9. The method according to claim 3, wherein said tag 1 2 is a number-of-tests-per-value tag.
- 1 10. The method according to claim 3, wherein said model dependent directive is a mask-value directive. 2

11. The method according to claim 1, wherein said directive comprises a plurality of directives that are combined to define a directive expression, wherein said step of generating is performed until said directive expression has a predetermined value.

- 12. The method according to claim 1, wherein said step of modeling is performed by retrieving said behavioral model from a model archive.
- 13. The method according to claim 1, wherein said step of associating is performed by retrieving said focus from a focus archive.
- 14. The method according to claim 13, further comprising the steps of comparing state variables of foci of said focus archive with state variables of said behavioral model; and
- responsive to comparisons resulting from said step of comparing revising selected ones of said foci.
- 1 15. A computer software product, comprising a computer-readable medium in which computer program instructions are stored, which instructions, when read by a computer, cause the computer to execute a method of test generation for testing computer software, the method comprising the steps of:

accepting as a first input a behavioral model of a software application, wherein said behavioral model comprises a finite state machine;

accepting as a second input a focus having a reference to said behavioral model, and having at least one directive;

associating said behavioral model with said focus; and

generating a test program according to state transitions of said behavioral model and said directive of said focus.

- 16. The computer software product according to claim 15, wherein said directive comprises a model independent directive.
- 17. The computer software product according to claim 15, wherein said directive comprises a model dependent directive, and a coverage variable of said behavioral model is tagged by a tag of said model dependent direc-4 tive, said coverage variable having allowable values. 5
- 18. The computer software product according to 1 claim 17, wherein said directive further comprises a 2 3 model independent directive.
- 19. The computer software product according to 1 claim 17. wherein said test program references said cov-2

- 3 erage variable, and said step of generating is performed 4 until said coverage variable has assumed each of said al-
- 5 lowable values
  - 20. The computer software product according to claim 19, wherein said coverage variable comprises a plurality of coverage variables, and said step of generating is performed until a cross product of said coverage variables has assumed all possible values thereof.
  - 21. The computer software product according to claim 19, wherein said coverage variable comprises a plurality of coverage variables, and said step of generating is performed until an orthogonal array of said coverage variables has assumed all possible values thereof.
  - 22. The computer software product according to claim 17, wherein said model dependent directive comprises a plurality of model dependent directives, and said coverage variable is tagged by a plurality of tags of said model dependent directives.
- 1 23. The computer software product according to 2 claim 17, wherein said tag is a number-of-tests-per-value 3 tag.

7

2

- 1 24. The computer software product according to 2 claim 17, wherein said model dependent directive is a 3 mask-value directive.
  - 25. The computer software product according to claim 15, wherein said directive comprises a plurality of directives that are combined to define a directive expression, wherein said step of generating is performed until said directive expression has a predetermined value.
  - 26. The computer software product according claim 15, wherein said step of modeling is performed by retrieving said behavioral model from a model archive.
  - 27. The computer software product according to claim 15, wherein said step of associating is performed by retrieving said focus from a focus archive.
- The computer software product according to claim 27, further comprising the steps of comparing state 2 variables of foci of said focus archive with state vari-3 4 ables of said behavioral model; and
- responsive to comparisons resulting from said step of 5 comparing revising selected ones of said foci. 6
- 1 29. A method of test generation for testing computer 2 software, comprising the steps of:

6

7

8

71

3 modeling a software application as a finite state ma-4 chine to define a behavioral model;

associating said behavioral model with a focus, said focus having a reference to said behavioral model, and having at least one directive;

deriving an abstract test suite from said behavioral model and said focus, wherein said abstract test suite complies with a test constraint that is encoded in said focus;

executing said abstract test suite in an execution engine.

- 30. The method according to claim 29, wherein said step of executing said abstract test suite comprises the step of generating a test script from said abstract test suite; wherein said test script is executed in said execution engine.
- 31. The method according to claim 29, wherein said 2 step of producing said abstract test suite is performed 3 with a testing interface.
- 1 32. The method according to claim 31, wherein said 2 testing interface comprises an abstract-to-concrete 3 translation table.

33. The method according to claim 29, wherein said testing interface comprises a test driver, having an operator interface, and further comprising the step of:

varying parameters of said test driver via said operator interface in accordance with requirements of said software application.

- 34. The method according to claim 29, wherein said directive comprises a model independent directive.
- 35. The method according to claim 38 wherein said coverage variable comprises a plurality of coverage variables, and said step of generating is performed until a cross product of said coverage variables has assumed all possible values thereof.
- 36. The method according to claim 38, wherein said coverage variable comprises a plurality of coverage variables, and said step of generating is performed until an orthogonal array of said coverage variables has assumed all possible values thereof.
- 37. The method according to claim 29, wherein said directive comprises a model dependent directive, and a coverage variable of said behavioral model is tagged by a tag of said model dependent directive, said coverage variable having allowable values.

- 38. The method according to claim 37, wherein said abstract test suite references said coverage variable, and said step of generating is performed until said coverage variable has assumed each of said allowable values.
  - 39. The method according to claim 37, wherein said directive further comprises a model independent directive.
  - 40. The method according to claim 37, wherein said model dependent directive comprises a plurality of model dependent directives, and said coverage variable is tagged by a plurality of tags of said model dependent directives.
  - 41. The method according to claim 37, wherein said tag is a number-of-tests-per-value tag.
- 1 42. The method according to claim 37, wherein said 2 model dependent directive is a mask-value directive.
- 1 43. The method according to claim 29, wherein said 2 directive comprises a plurality of directives that are 3 combined to define a directive expression, wherein said 4 step of generating is performed until said directive expression has a predetermined value.

- 44. The method according to claim 29, wherein said step of modeling is performed by retrieving said behavioral model from a model archive.
  - 45. The method according to claim 29, wherein said step of associating is performed by retrieving said focus from a focus archive
  - 46. The method according to claim 29, further comprising the steps of comparing state variables of foci of said focus archive with state variables of said behavioral model; and

responsive to comparisons resulting from said step of comparing revising selected ones of said foci.

47. A computer software product for testing computer software, comprising a computer-readable medium in which computer program instructions are stored, which instructions, when read by a computer, cause the computer to perform the steps of:

associating a behavioral model of a software application with a focus, said focus having a reference to said behavioral model, and having at least one directive, wherein said behavioral model models a finite state machine:

deriving an abstract test suite from said behavioral model and said focus, wherein said abstract test suite

13 complies with a test constraint that is encoded in said 14 focus;

15 executing said abstract test suite in an execution 16 engine.

- 48. The computer software product according to claim 47, wherein said step of executing said abstract test suite comprises the step of generating a test script from said abstract test suite; wherein said test script is executed in said execution engine.
- 49. The computer software product according to claim 47, wherein said step of producing said abstract test suite is performed with a testing interface.
- 50. The computer software product according to claim 49, wherein said testing interface comprises an abstract-to-concrete translation table.
- 51. The computer software product according to claim 49, wherein said testing interface comprises a test driver, having an operator interface, and further comprising the step of:

varying parameters of said test driver via said operator interface in accordance with requirements of said software application.

- 1 The computer 52. software product according claim 47, wherein said directive comprises a model inde-3 pendent directive.
  - The computer software product according to claim 29, wherein said directive comprises a model dependent directive, and a coverage variable of said behavioral model is tagged by a tag of said model dependent directive, said coverage variable having allowable values.
  - 54. The computer software product according to claim 53 wherein said coverage variable comprises a plurality of coverage variables, and said step of generating is performed until a cross product of said coverage variables has assumed all possible values thereof.
- 1 55. The computer software product according to 2 claim 53, wherein said coverage variable comprises a plu-3 rality of coverage variables, and said step of generating 4 is performed until an orthogonal array of said coverage S variables has assumed all possible values thereof.
- computer software product according 1 2 claim 53, wherein said abstract test suite references said coverage variable, and said step of generating is 3 performed until said coverage variable has assumed each 4 of said allowable values. 5

- 1 57. The computer software product according to 2 claim 53, wherein said directive further comprises a 3 model independent directive.
  - 58. The computer software product according to claim 53, wherein said model dependent directive comprises a plurality of model dependent directives, and said coverage variable is tagged by a plurality of tags of said model dependent directives.
  - 59. The computer software product according to claim 37, wherein said tag is a number-of-tests-per-value tag.
  - 60. The computer software product according to claim 37, wherein said model dependent directive is a mask-value directive.
- 1 61. The computer software product according to
  2 claim 47, wherein said directive comprises a plurality of
  3 directives that are combined to define a directive ex4 pression, wherein said step of generating is performed
  5 until said directive expression has a predetermined
  6 value.

1 62. The computer software product according to claim 47, wherein said step of modeling is performed by 2 retrieving said behavioral model from a model archive. 3

- 63. The computer software product according to claim 47, wherein said step of associating is performed by retrieving said focus from a focus archive.
- 64. The computer software product according to claim 63, further comprising the steps of comparing state variables of foci of said focus archive with state variables of said behavioral model; and

responsive to comparisons resulting from said step of comparing revising selected ones of said foci.

- 65. A computer system for testing computer software, comprising:
- a user interface for creating a behavioral model of a software application, said behavioral model representing a finite state machine, wherein said user interface creates a focus, said focus having a reference to said behavioral model, and having at least one directive;
- a compiler, for converting said behavioral model into an intermediate encoding thereof;
- a test generator, accepting said intermediate encod-10 ing and said focus as input, and producing an abstract 11

12 test suite;

3

40388 Ver. 40388S4

- 13 an execution engine for executing a test program of 14 said abstract test suite.
- 1 66. The system according to claim 65, wherein said 2 execution engine produces a suite execution trace.
  - 67. The system according to claim 66, further comprising an analyzer which reads said suite execution trace, wherein said execution engine accepts an output of said analyzer.
  - 68. The system according to claim 65, further comprising a visualizer for visualizing an output of said execution engine.
  - 69. The system according to claim 65, wherein said execution engine further receives input from an application model interface that is created by said user interface.
- 1 70. The system according to claim 65, wherein said 2 directive comprises a model independent directive.
- 1 71. The system according to claim 65, wherein said 2 directive comprises a model dependent directive, and a
- 3 coverage variable of said behavioral model is tagged by a
- 4 tag of said model dependent directive, said coverage
- 5 variable having allowable values.

8.0

2

4

72. The system according to claim 71, wherein said directive further comprises a model independent directive.

- 73. The system according to claim 71, wherein said test program references said coverage variable, and said test generator operates until said coverage variable has assumed each of said allowable values.
- 74. The system according to claim 73, wherein said coverage variable comprises a plurality of coverage variables, and said execution engine executes until a cross product of said coverage variables has assumed all possible values thereof.
- 75. The system according to claim 73, wherein said coverage variable comprises a plurality of coverage variables, and said execution engine executes until an orthogonal array of said coverage variables has assumed all possible values thereof.
- 76. The system according to claim 71, wherein said model dependent directive comprises a plurality of model dependent directives, and said coverage variable is tagged by a plurality of tags of said model dependent directives.

1

40388 Ver. 40388S4

- 77. The system according to claim 71, wherein said 1 tag is a number-of-tests-per-value tag.
- 78. The system according to claim 71, wherein said 2 model dependent directive is a mask-value directive.
  - 79. The system according to claim 65, wherein said directive comprises a plurality of directives that are combined to define a directive expression, wherein said execution engine executes until said directive expression has a predetermined value.
  - 80. The system according to claim 65, further comprising a model archive that is accessed by said user interface.
- 81. The system according to claim 65, further comprising a focus archive that is accessed by said user in-3 terface
